## 0/1 Knapsack Problem

0/1 Knapsack  
CLASSMATE

Date \_\_\_\_\_

Page \_\_\_\_\_

Suppose we are given " $n$ " objects and a Knapsack capacity  $M$ , where each object has its weight  $w$  and its profit  $p$ . The objective is to obtain a filling of a Knapsack that maximizes the total profit  $\sum_{0 \leq i < n} p_i x_i$  such that  $\sum_{0 \leq i < n} w_i x_i \leq M$ . The capacity of Knapsack, we require the total weights of all chosen objects must be maximum to  $M$ . Therefore, the object is to maximize  $\sum p_i x_i$  maximum and subject is in limit to  $\sum w_i x_i \leq M$ .

### Example

Suppose we have a Knapsack  $M=8$  and  $n$  number of objects we need to fill, where each object's profits & weights are as follows:

$$P = \{1, 2, 5, 6\}$$

$$W = \{2, 3, 4, 5\}$$

$M = 8$

$$\max \sum p_i x_i \text{ (Max)}$$

$$\sum w_i x_i \leq M$$

For solving a problem, using dynamic approach, we need to create a  $V$  table which contains weights (Knapsack weights).

and list of items, with their corresponding weight  $w$  and Profit  $p$ . The objective is to fill the table corresponding to its current capacity of Knapsack and objects selection. If the object(s) are fit in the Knapsack  $M$ , then we write its profit  $p$ . Here objective is to get (4, 8) → Knapsack  $M$  consideration  
 → No. of items consideration

|     |     | $M$ |   |   |   |   |   |   |   |   |   |
|-----|-----|-----|---|---|---|---|---|---|---|---|---|
|     |     | $i$ | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| $p$ | $w$ | 0   | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 1   | 2   | 1   | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| 2   | 3   | 2   | 0 | 0 | 1 | 2 | 2 | 3 | 3 | 3 | 3 |
| 5   | 4   | 3   | 0 | 0 | 1 | 2 | 5 | 5 | 6 | 7 | 7 |
| 6   | 5   | 4   | 0 | 0 | 1 | 2 | 5 | 6 | 6 | 7 | 8 |

The same can also be obtained as

$$V[i, w] = \max \{ V[i-1, w], V[i-1, w-w[i]] + p[i] \}$$

Examples

$$\begin{aligned}
 V[4, 1] &= \max \{ V[3, 1], V[3, (1-5)] + 6 \} \\
 &= \max \{ 0, 0 \} \\
 &= 0
 \end{aligned}$$
